

# THE OCTALAND

Designed And Built By KINGTONE

The Octaland has been designed from the ground up to produce the strongest and most playable high octave tones.

# OCTALAND INSTRUCTIONS

## DRIVE CONTROL

The OCTALAND features a wide drive control, this allows you to go from an almost clean tone to a full-on fuzz/overdriven solo tone

The Octaland features a wide drive control, allowing you to go from almost clean to full on lead tones and everything in between. Unlike other octave pedals the Octaland retains the high octave even at high drive settings.

## VOLUME CONTROL

The OCTALAND high output volume control allows you to easily overdrive even the most stubborn tube amp

Use the volume control to boost solos or overdrive your tube amp. As with any octave or fuzz pedal, you'll get the best results with a slightly overdriven amp or running the pedal into an overdrive or distortion pedal. The Octaland has a high output volume which can be used to push your amp into overdrive or just lift your volume for lead breaks.

# OCTALAND INSTRUCTIONS

## VOICE CONTROL

The VOICE control is an advanced two way tone control

Moving the VOICE control clockwise accentuates the high octave and thickens the tone.  
Rotating the VOICE control counter clockwise, softens and warms the tone.

## BLEND CONTROL

The BLEND control allows you to mix between the Octave tone and a clean or fuzz tone

Rotating the BLEND control fully counter clockwise gives you a clean tone with no high octave.  
With the DRIVE control high, the clean setting becomes a fuzz.  
With the BLEND control fully clockwise you only hear the high octave tone;  
this setting produces the strongest upper octave tones.  
Setting the BLEND control anywhere in between will give you a varying mix of clean and octave.
